### Abstract

Cities of tomorrow will invest knowledge sources in driving creative-led and culture-driven urban regeneration that contribute to revitalizing urban spaces and driving sustainable and inclusive urban growth, leading to community development and engagement. Urban regeneration processes enable creative cities to be socially inclusive communities that rediscover the importance of collaborative innovation as a framework that helps shape wealthy urban spaces into engines of social innovation. It is relevant to map the present state of knowledge and practices to better prepare for future creative cities. The present paper investigates the relationships between creative cities and urban regeneration, as presented by the main academic outlets. The current bibliometric analysis identified five main research dimensions: macro-level phenomena, urban regeneration based on culture and communities, cultural policies, sustainability, and policies leading to the sustainable development of creative cities.

**Keywords** – Creative cities, culture-led urban regeneration, collaborative spaces.
